

ABSTRACT

1
2 An aneurysm treatment device for *in situ* treatment of aneurysms comprising a
3 collapsible member having a first shape wherein the first shape is an expanded
4 geometric configuration, and a second shape, wherein the second shape is a
5 collapsed configuration that is loadable into a catheter. The aneurysm treatment
6 device is capable of returning to the first shape in the lumen of an aneurysm. Some
7 aneurysm treatment devices comprise a spreadable portion and a projecting portion
8 integral with the spreadable portion. The spreadable portion is capable of resting
9 against and supporting an inner wall of an aneurysm, the projecting portion is
10 capable of being gripped by a surgeon to facilitate insertion and positioning of the
11 device. Other devices have relatively simple shapes and can be implanted to a site
12 as a plurality. Treatment methods are also disclosed.
